1. Introduction

Project Title: EduTutor AI with IBM

Purpose:

The purpose of EduTutor AI with IBM is to provide an intelligent educational assistant that supports learners and educators in optimizing the learning experience. By leveraging AI, real-time feedback, and data-driven recommendations, EduTutor AI helps students improve their academic performance while offering personalized guidance.

2. Features:

- Conversational Interface for natural interaction
- Content Summarization for quick learning
- Performance Forecasting using data
- Quiz Generator for practice
- Study Tips Generator personalized for users
- Feedback System for interactive improvement
- Resource Recommendations aligned with content
- Multimodal Input Support for diverse formats
- User-Friendly Dashboard

3. Architecture:

Frontend (Streamlit): Interactive UI with dashboards, file uploads, chat, reports, and feedback forms.

Backend (Fast API): API endpoints for document summarization, quizzes, learning recommendations, and user interaction.

LLM Integration (IBM Watsonx Granite): Natural language understanding for content generation and summarization.

Vector Search (Pinecone): Semantic search across educational documents using embeddings.

ML Modules: Prediction models for academic forecasting and anomaly detection using Scikit-learn.

4. Setup Instructions:

Prerequisites:

- Python 3.9 or later
- pip and virtual environment tools
- API keys for IBM Watsonx and Pinecone
- Internet access

Installation Process:

- Clone the repository
- Install dependencies from requirements.txt
- Configure credentials in a .env file

- Run the backend server using FastAPI
- Launch the frontend via Streamlit
- Upload learning materials and start interacting

5. Running the Application:

Start the FastAPI server, launch the Streamlit interface, upload content, and use the features in real time to access educational tools and resources.

6. API Documentation:

Available endpoints include querying educational content, uploading documents, fetching summaries, and providing feedback—all documented via Swagger UI for easy testing and development.

7. Authentication:

The system supports token-based authentication, OAuth2, and role-based access controls to ensure secure usage. Future enhancements will include user session tracking and history logs.

8. User Interface:

A minimalist and accessible interface designed for non-technical users, with navigation panels, real-time interaction, data visualizations, and intuitive layouts.

9. Testing:

Testing includes unit tests for functions, API validation through Swagger and Postman, and manual reviews to ensure consistency, accuracy, and robustness.

10. Future Enhancements:

Plans include expanding AI capabilities, integrating more learning analytics, and improving accessibility features for diverse user groups.
